# Foreword

This book on software development is meant for beginners, who want to learn software coding on PowerBuilder. There are techniques to develop screens, with the detailed use of the screens and their place in the software. If anyone is interested in having the source code they may contact these email IDs:

[ravi\\_kp\\_com@yahoo.com](mailto:ravi_kp_com@yahoo.com) or  
[ravikiransofttech@gmail.com](mailto:ravikiransofttech@gmail.com)

My Books website: <http://ravikirantechosoft.in/>

Or <https://ravikumar.azurewebsites.net>

All my book links are available on the website.

Also, free pdf copies are available.

You are welcome to contact me for any kind of support.

Write to me @ [ravi\\_kp\\_com@yahoo.com](mailto:ravi_kp_com@yahoo.com) for a quicker reply.

Ravi Kumar Paramkusam

Software Professional and Writer

# Preface

In my 30+ years of experience I have Developed many software for many companies in different technologies and different domains. I have worked extensively with PowerBuilder and Visual Studio developing Applications and web applications. This book is about how to start with PowerBuilder Software and how to program applications. It is assumed that you have some basic knowledge of using PowerBuilder. The First part is developing master windows for use in the development with inheritance and datawindows, the two pillars of the PowerBuilder for Rapid Application Development(RAD) tool.

The Second Part is actual development using these master windows.

Ravi Kumar Paramkusam

# Acknowledgements

This is to acknowledge the developers who have worked with me all these years.

*This book is dedicated to all the companies and developers, I worked for and developed software.*

## PART 1

# Developing Master Windows

# Chapter 1

## Introduction

PowerBuilder is a GUI-based software development tool that follows all OOPS concepts.

Inheritance is the main concept in developing in ‘PB’ in short it is called, which reduces the development time.

PB is an evolving software. From v5 in 1998 now after releasing v12.5, they started naming versions by the year. The latest version is the 2022R3 customer release Beta.

Some say “Thousands of PowerBuilder applications still run today. Even though the platform is supposedly supported, its development has been slow in the past decade. It has changed hands multiple times which has caused the technology to become less desirable and lacking basic functionality from more modern platforms.”

But it is not true that it lacks basic functionality, it is a robust program and ‘datawindows’ is the best functionality that exists on any platform. Datawindows allows to retrieve the data from tables and allows it to update the tables with just one command. It can recognise whether the data is newly updated, modified, or deleted and act accordingly.

PowerBuilder is compatible with all the modern databases. It comes preloaded with most of the database drivers. Others can be downloaded from their respective websites.

It has the latest functionality to update with JSON, XML, or any other type of data like Excel, CSV or any other table-based data.

New releases of the PB mostly focus on .net compatibility. From Version 11 conversion to .net, they started. The code can be converted to Asp.Net and ported to IIS and run as a web-based application.

The latest version contains Powerscript migrator, which converts PowerBuilder code to C# code.

Powerserver helps to distribute the PowerBuilder application through the web to multiple locations.

But first I will show how to create master windows for the best performance. This is the first step in developing applications at a rapid speed.

There are two main master windows one with a single datawindow for master data entry and two datawindows for master, details type data entry. Then there are two types of report masters. The first type does not use any retrieval arguments and is mainly useful for displaying master data and simple reports. The second report master window uses retrieval arguments like dates and other data. Based on the data selected the report is retrieved and there are buttons for zooming the data and sending it to a printer.

## Development of Master windows

This is the single datawindow master window. The white space in the middle of the window is the one where we will place datawindow. I will show how the datawindow is made later in the chapter.

Now let us see what the page consists of. The ribbon containing the commands Save, Modify, View, Delete and Cancel is called a user object. A user object can be created and this object is created by placing buttons and writing code for the buttons.

### **Global variables**

```
string coname, addok, am, fayear, module, machine, loc,  
usrname  
string voutype, ind_pol, corp_pol, pre_auth, claim_reg,  
companynname, company, branch, ls_string, gs_fayear,  
gs_custcd, claim_proc, claim_set, mis_rep , ttype  
date std_date,today  
datetime lst_date,fafrdt,fatodt,sysdatetime  
int level  
long ctr,ref_no  
char login,item_flag  
int ts  
DataWindow gdw1, gdw2  
string gs_which_window  
char o_flag, sales, stores,purchase, finance, setup, other  
datawindow dw_x  
datawindowchild dwc  
string pay,fin,pname,g_logincd,g_login,stype  
string chk, subaccd  
real amt  
long vouno
```

```
string ptype,ins_co,ins_type,contype
```

### Instance variables for user object

```
datawindow dw_1
```

```
boolean commit_flag,save_flag
```

```
function: uof_reg returns none, input datawindow dw_1a
```

```
dw_1=dw_1a
```

### Code for save button:

```
dw_1.setredraw(false)
```

```
integer rtn
```

```
if delete_flag = true then
```

```
if messagebox("CONFIRM DELETE", "Are you sure you  
want to delete this record?",Question!,YesNo!,2) = 1 then
```

```
    rtn = dw_1.deleteRow(0)
```

```
    if rtn = 1 then
```

```
        parent.triggerevent("delete_event")
```

```
        rtn = dw_1.update()
```

```
        if rtn = 1 then
```

```
            commit using sqlca;
```

```
w_mastermenu.sle_1.text = "Record has been deleted."
```

```
        delete_flag = false
```

```
        pb_cancel.triggerevent("clicked")
```

```
    else
```

```
messagebox("Deletion Error","Related Data Exists
```

```
        pb_cancel.triggerevent("clicked")
```

```
end if
```

```
end if
```

```
end if
```

```
else
```

```
parent.triggerevent("save_before_event")
```

```
if update_flag = true then
```

```
    rtn = dw_1.update()
```

```
    if rtn = 1 then
```

```
        parent.triggerevent("save_event")
```

```
        if commit_flag = true then
```

```
        commit using sqlca;
w_mastermenu.sle_1.text = "Records have been saved."
    update_flag = false

    pb_cancel.triggerevent("clicked")
        else
            rollback using sqlca;
        end if
    else
        messagebox("Save Error","Save has been cancelled")
            rollback using sqlca;
        end if
    else
        rollback using sqlca;
    end if
end if
dw_1.setredraw(true)
```

**code for modify button:**

```
dw_1.setredraw(false)
delete_flag = false
parent.triggerevent("modify_before_event")
if ts=1 then
    return 1
end if
dw_1.reset()
dw_1.insertrow(0)
dw_1.setfocus()
parent.triggerevent("modify_event")
dw_1.setredraw(true)
```

**code for view button:**

```
dw_1.setredraw(false)
delete_flag = false
parent.triggerevent("view_before_event")
if ts=1 then
    return 1
end if
```

```

dw_1.reset()
dw_1.insertrow(0)
dw_1.setfocus()
parent.triggerevent("view_event")
dw_1.setredraw(true)
code for delete button:
dw_1.setredraw(false)
parent.triggerevent("delete_before_event")

if ts=1 then
    return 1
end if
dw_1.reset()
dw_1.insertrow(0)
dw_1.setfocus()
dw_1.setredraw(true)
Code for cancel button:
parent.triggerevent("cancel_event")

Code for exit button:
if dw_1.modifiedcount() + dw_1.deletedcount() > 0 then
    if messagebox("UNSAVED CHANGES!","Do you
wish to exit without saving?",Question!,YesNo!,2) = 1 then
        close(parent)
    end if
else
    close(parent)
end if

```

**Next code for the master window:**

**Code for open event of the window:**

```

dw_1.settransobject(sqlca)
w_mastermenu.pb_1.enabled = false
uo_2.uf_register(dw_1)
setbuttons(true)
uo_2.pb_new.triggerevent(clicked!)
i_height = this.height

```

```
i_width = this.width  
sle_1.taborder = 0  
dw_1.modify("datawindow.color='"+string(rgb(216,228,2  
48))+""")  
rr_1.fillcolor=rgb(216,228,248)  
return 0
```

**Code for close event:**

```
w_mainmenu.pb_1.enabled = true  
// the main window will open  
commit using sqlca;  
// all the pending data updates will be committed
```

**clicked event of the window – useful for web application**

```
#IF Defined PBDOTNET THEN  
    dw_1.JavaScriptFile = "MyScriptFile.js"  
    dw_1.OnClientClicked = "MyDWClickedEventHandler"  
#END IF  
****
```

**Instance variables**

```
integer i_height, dw_height,dw_width  
integer i_width,error_flag  
string i_dml_flag,colname  
long l_rows  
int finyear
```

**Function setbuttons: Boolean a\_type as input returns none**

```
//this function sets the buttons as per the user type and  
module can be reconfigured  
//string add,del ,mod  
//Instant variables datawindow dw_1, boolean  
update_flag, //delete_flag, newflag,commit_flag  
add='N'  
del='N'  
mod='N'  
addok='N'  
if level=0 or level>3 then
```

```

addok='Y'
add='Y'
mod='Y'
del='Y'
end if
if add = 'Y' then
    addok='Y'
else
    addok='N'
end if
if add="Y" then
    uo_2.pb_new.enabled=true
else
    uo_2.pb_new.enabled=false
end if
if mod = 'Y' then
    uo_2.pb_modify.enabled=true
else
    uo_2.pb_modify.enabled=false
end if
if del = 'Y' then
    uo_2.pb_delete.enabled=true
else
    uo_2.pb_delete.enabled=false
end if
if add = 'N' and del = 'N' and mod ='N' then
    uo_2.pb_save.enabled=false
else
    uo_2.pb_save.enabled=true
end if
uf_enable_on_prev input string ucode
string new,mod,del,view
declare privledges cursor for
    select privnew,privdel,privmod,privview
    from users
    where ucode = :ucode
    using sqlca;

```

```
open priviledges;
fetch priviledges into :new,:del,:mod,:view;
if sqlca.sqlcode <> 0 then
    messagebox("SQL ERROR",sqlca.sqlerrtext)
    close priviledges;
    return
end if
close priviledges;
if new = 'Y' then
    pb_new.enabled = true
    pb_save.enabled = true
end if
if del = 'Y' then
    pb_delete.enabled = true
    pb_save.enabled = true
end if
if mod = 'Y' then
    pb_modify.enabled = true
    pb_save.enabled = true
end if
if view = 'Y' then
    pb_view.enabled = true
end if
uf_register input by ref datawindow a_dw_1

**PART 2**

**Develop Application using Master  
windows**

## Chapter 1

### TPA Software

Let us take a case where we have to start from scratch.

I will take an example of the Health Insurance TPA I worked on from scratch. They were not using any software, except using Excel for saving some data.

First, I will explain the processes. There are two processes individual policies and corporate or group policies. Individual policies contain single-person details. Name, age, amount insured, and address of the person. These individuals are issued a single ID card with a photo, name, age, amount, and insurance company, and these are printed on preprinted label paper with the TPA name and address, telephone nos, etc. The first thing we have to do is feed the individual data and attach a photo to his data. When we enter a certain no of data, we can print it on the label paper. Then the labels are cut and stacked then these will be sent to the addresses. The same way the address labels are printed.

One thing I found after seeing the individual data are they are not so individual, each individual may have dependents like spouse, sons and daughters, parents, brothers and sisters. Each will share the same address. We decided to use the Head and details scheme for entering data. The main members' data is entered on the header and address. In the details section each individual name, age, relation, and amount are entered. These header and details data are linked with a single id or number. The detailed data is entered in serial nos. The photos are stored in a server with the linking id. So, when printing labels the photos are picked from the server and printed.

The same principle is used for corporate policies. Here corporate details are entered in a separate table and linked when data is entered. The header will contain the corporate code, individual/employee name, employee ID, and policy amount. Here is mostly an amount allotted for

each employee which will be for all the members of the family. Sometimes a floating amount is also allotted for the corporation. Which can be used when the individual amount is used fully. Here same way data is entered photos stored and labels printed. Here the printed IDs are sent to the corporate office.

I have not prepared any documents and worked on the application as it was brought to me. I worked on the development and maintenance part for around 4 to 5 years as there were changes in the requirements as brought by adding other insurance companies or requirements by the existing insurance companies.

First, we need to prepare SQL tables.

Let us see what the table structure for Hospital Master Table, then we will see how to make datawindow and attach it to a window and run without adding any more code.

```
CREATE TABLE dbo.hospitals (hs_cd varchar(5) NOT NULL ,  
hs_name varchar(80) NOT NULL , co_add1 varchar(30)  
NOT NULL , co_add2 varchar(30) , co_add3 varchar(30) ,  
city varchar(4) NOT NULL , pincode varchar(10) , usrcd  
varchar(5) NOT NULL , sysdate datetime NOT NULL , hs_gr  
varchar(5) , bankacno varchar(30) , bankname varchar(50)  
, bankcity varchar(30) , hs_type char(1) , nims_tariff  
char(1) , reg_no varchar(50) , pan_no varchar(50) , grade  
char(1) , email varchar(50) , actype varchar(20) , ifsc_code  
varchar(50) , branch_code varchar(50) , discount  
varchar(10) , micr varchar(15) , tan_no varchar(20) ,  
chq_name varchar(50) , tds_ys char(1) , tds_date  
smalldatetime , tds_prc numeric(5,2) , serv_tax_no  
varchar(30) , ph_no varchar(10) , ppn_type char(1) ,  
nia_code varchar(30) , CONSTRAINT hospitals_cd PRIMARY  
KEY (hs_cd)) ;
```

### Datawindow Query:

```

SELECT hospitals.hs_cd,          hospitals.hs_name,
       hospitals.co_add1,        hospitals.co_add2,
       hospitals.co_add3,        hospitals.city,
       hospitals.pincode,        hospitals.usrcd,
       hospitals.sysdate,        hospitals.hs_gr,
       hospitals.bankacno,       hospitals.bankname,
       hospitals.bankcity,       hospitals.hs_type,
       hospitals.nims_tariff,    hospitals.reg_no,
       hospitals.pan_no,         hospitals.grade,
       hospitals.email,          hospitals.actype,
       hospitals.ifsc_code,      hospitals.branch_code,
       hospitals.discount,       hospitals.micr,
       hospitals.tan_no,         hospitals.chq_name,
       hospitals.tds_ys,         hospitals.tds_date,
       hospitals.tds_prc,        hospitals.serv_tax_no,
       hospitals.ph_no,          hospitals.ppn_type,
       hospitals.nia_code

```

FROM hospitals

WHERE hospitals.hs\_cd = :cd

Create a datawindow in Freeform with the above sql query and add cd string as a retrieval argument.

Create another datawindow with the above query without the where clause in either Grid or Tabular form.

Save them and put the first one on dw\_1 and the second one on dw\_2 using master with 2 datawindows with list option.

You can add the window to the menu and can check. The Window will run without any further code.

**The window code, convertible to window:**

```

The data entry screens for these entries: some part of the details screen is hidden here.

The screenshot shows a software interface for 'Policy Entry'. The main window title is 'Policy Entry' and it includes a menu bar with 'Policy Entry', 'Claim Processing', 'ID Cards Issue', 'Address Print', 'Documents', 'Reports', 'Masters', and 'Quit'. Below the menu is a toolbar with buttons for 'Save', 'Modify', 'Delete', 'View', 'Cancel', and 'Exit'. A sub-menu 'Policy Entry' is open, showing 'Report' and 'Modify' options.

The main form contains the following fields:

- Ref.No: 1347
- Pol.No: 512...J9
- Policy From: 11/07/2004
- Pol. To: 10/07/2005
- Branch: KHTB
- Pol.Type: INDIVIDUAL POLICY
- Remarks:
- Agent Cd:
- Insured Name: MR. SURESH KUMAR M R LALANI
- Address: 1, 4, SOUTHERN AVENUE, PASTI
- Dev.Officer: 10/09/2004
- Prev Policy No: 2003 J 1200000300516
- Sum Ins.: 00
- Net Premium: 1,217.00
- Decl Date: 10/07/2003
- Zone:
- City: SPARKS ROAD
- Pincode: 500001
- GHPID ID: G-L-NIA-01347
- Date: 14-11-2006
- Bank Name:
- A/C.No.:
- Bank Branch:
- Name of A/c Holder:
- IFSC Cd:
- A/c type: Mobile

Below the main form is a data window titled 'dw\_1' containing a grid of insured individuals:

Sino	Ghpl Id	Name of the Insured	DOB	Age	Sex	Occupation	Relation	Sum Insured	Cum% Bo
1	G-L-NIA-01347-1	MR. SURESH KUMAR M R LALANI	00/00/0000	30	F	HOUSE WIFE	SELF	50,000	5.00
2	G-L-NIA-01347-2	MARY T HENRY LOUISE	00/00/0000	5	F	STUDENT	DAUGHTER	50,000	5.00

At the bottom of the window, there is a message 'Please Change POLICY\_NO', a status bar showing 'UIA 09:03:33', and a user name 'Ravi Kumar'.

Query for the dw\_1 datawindow

```

The query for dw\_1: for the report

```

SELECT policy_head.policy_no, policy_det.ghpl_id,
policy_det.name_insured, policy_det.age,
policy_det.sex, policy_head.policy_from,
policy_head.policy_to, policy_det.photo_path,
pol_types.id_type, policy_head.ins_co,
policy_head.decl_date, BON=isnull(cum_prc,0)
FROM policy_head,pol_types, policy_det
WHERE ( policy_head.pol_type = pol_types.pol_type )
and ( policy_det.ref_no = policy_head.ref_no ) and
( ( policy_det.ghpl_id between :frno and :tono ) )

```

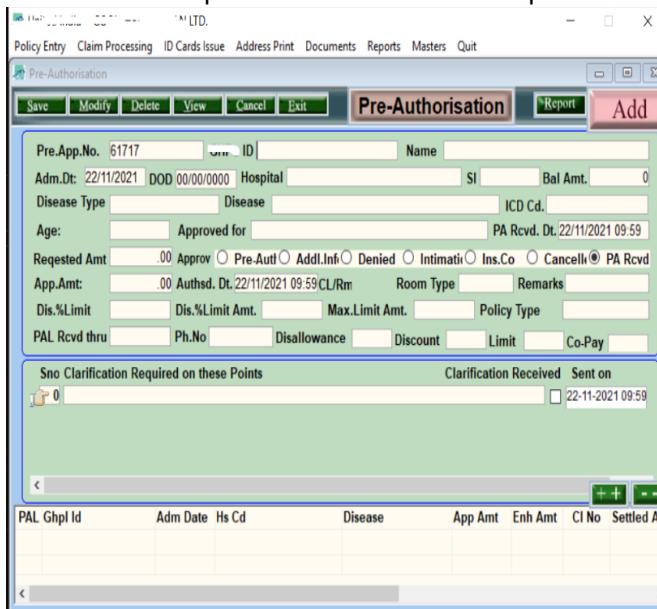

The above is an id printing screen. Photos are not printed on the above screen. These reports are set to pre-printed labels.

Now the Ids are printed from the above screen, cut, laminated, and dispatched.

An individual wants to join a hospital, he goes to the hospital shows his id and he is admitted and his details are sent to the TPA. The TPA received the data and verifies the data if he is eligible for the treatment and approval will be sent to the hospital else a denial will be sent to the

hospital. For creating the approval, we need to enter the hospital request.

Once we receive the request a request entry will be made in the system. The details will include the id of the person, hospital name, name of the disease, and amount requested by the hospital for treatment. There will be a panel of doctors with the TPA who verifies the details of the disease and procedures and the expected amount and amount available in the individual policy and issue approval. Which is fed in the system and an approval letter is printed and sent to the hospital. If the request is denied a denial letter is printed and sent to the hospital.

The query for dw\_1:

```
SELECT          pre_approvals.pre_app_no      ,
pre_approvals.ghpl_id ,      pre_approvals.adm_date ,

```

The claim is processed by the claims executive. Sometimes more details are required from the hospital. These details are fed into the system. If an individual claims the amount, then clarification is asked from the hospital. The request for more details if required is sent to the hospital and the claim status is set to under process. If the claim is payable each item from the bill is entered with the amount charges. For example, room rent is 10000, medicines are 5000. These items are entered. If the full amount is payable amount is entered as 10000, else only 9000 is payable it is entered as 9000, and 1000 is shown as declined. So, each amount is checked and the payable amount is entered. The final amount is treated as payable and declined amount. There are many processes are involved in the claim processing, which is entered through the claim registration

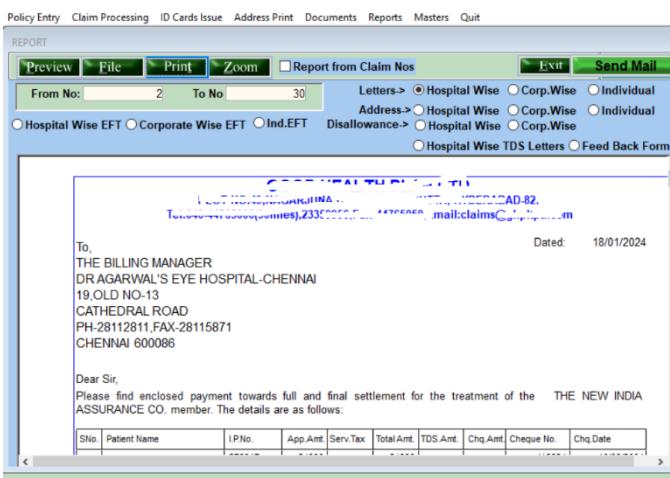

and claim processing screens. Every process in the claim processing is documented through the screens.

The screenshot shows a Windows application window titled "Claim Processing". The menu bar includes "Policy Entry", "Claim Processing", "ID Cards Issue", "Address Print", "Documents", "Reports", "Masters", and "Quit". The main window has tabs for "Save", "Modify", "Delete", "View", "Cancel", and "Exit". The "Claim Processing" tab is active, indicated by a red border. Below the tabs is a toolbar with "Show" and "Report" buttons. The main area contains several input fields: "Claim No." (33538), "Date" (18/07/2009), "PAL.No." (36455), "Sum.Ins." (0), "Bill No." (09-10B2597), "IP No." (68066), "D.O.A." (30/06/2009), "D.O.D." (01/07/2009), "No.Days" (1), "Approval" (Yes). Diagnoses listed are "GENERAL SYMPTOMS AND SIGNS" and "FEVER OF UNKNOWN ORIGIN PYREXIA OF UNKNOWN ORIGIN". Treatment details include "Procedure" (3E03329) and "TDS Arr." (00 702.00). Billing information shows "Total Bill Amt." (7017), "Hospital Confirmation Bill Amt." (0), "Room Days" (1), "ICCU Days" (0), "Pre" (0), "Post" (0), "Proc.Dt." (12/08/2009), "Paid To" (P), "Hosp.Bill" (7,017.00), "Disall Amt." (00), "Appr.Amt" (7017), "Disc.Amt" (0), "Co-Paymt" (0), "STx" (0), "Net Set.Amt." (7,017.00). Reasons for stay, float fund remittance, and status are also listed. Below these fields is a table with columns: Sno, Item, Claim.Amt, Dis.Allowd, Appr.Amt, Remarks. The table contains three rows: 1 ROOM RENT (2,400.00, 00, 2,400.00), 2 CONSULTANT (600.00, 00, 600.00), and 3 MEDICINES BY HOSPITAL (762.00, 00, 762.00). At the bottom of the window, there are buttons for "Pre.Cl.", "Set. 0.00", "Post.Cl.", "0", "Set. 0.00", "Doctor", and "Zone". The footer of the window displays fields: PAL.Ghpl.Id, Adm Date, Hs Cd, Disease, App Amt, Enh Amt, CI No, and Settled Am.

Dw\_1 query:

A claim sheet is printed and for the final payable amount, a cheque is prepared and sent for signature. So, based on these processes screens are prepared and printout report screens are provided.

The following is the settlement letter screen:

Dear Sir,  
Please find enclosed payment towards full and final settlement for the treatment of the THE NEW INDIA ASSURANCE CO. member. The details are as follows:

S.No.	Patient Name	I.P No.	App.Amt.	Serv.Tax	Total Amt.	TDS Amt.	Chq Amt.	Cheque No.	Chq Date
1	K SARASWATHI	276917	24930		24930			118824	10/09/2004
	Total		24930	0	24930	0	0		

Kindly acknowledge the above cheque and send us a one rupee revenue stamped receipt in the name of "Good Health Plan Limited".

If you have any queries, please get back to us within 7 days.

We look forward to a long term association for mutual benefit.

Thanking you,

Yours Sincerely

for Good Health Plan Ltd.

### The main menu for this project

This is a small project compared to others. This application was developed using PowerBuilder 11 with sqlserver2000 on a Windows server. But maintenance was done for 10 years. As requirements and new insurance companies were added, new types of policies came, new processes were introduced by the insurance companies, and constant modifications were necessary. Either in the application or in reports.

Web Application link to download developed using visual studio 2005, combidata.bak for sqlserver 2008. These are available in the following location in zip format.

<https://www.dropbox.com/s/ent1690a1kfxq1g/Web%20Application.zip?dl=0>

Powerbuilder Application available at this location:

[https://www.dropbox.com/s/x17g6in2bgcr987/rk\\_ghpl\\_pb11.zip?dl=0](https://www.dropbox.com/s/x17g6in2bgcr987/rk_ghpl_pb11.zip?dl=0)

## Chapter 2

Here I will explain some of the commands that will be useful in developing software.

Datawindow commands:

Dw\_1.insertrow(0) : inserts a row in datawindow dw\_1

Dw\_1.deletetow(rowno) marks for deletion the rowno

Dw\_1.update() updates the datawindow to the table

If the status of the dw\_1.getitemstatus(rowno,0,primary!) is new! the row will not be updated. If the status is NewModified the row will be inserted into the table. If the status is DataModified the row data is updated to the table. If NotModified! Nothing will happen.

Same way dw\_1.setitemstatus(rowno,colno,primary!,status) can

reset the status of the row or column with the status explained above.

There are many properties for datawindow which can be altered programmatically.

Dw\_1.accepttext() updates the text entered in the datawindow. It will be useful when checking the data entered in the present row. Data as the entered value can be checked after passing accepttext().

Dw\_1.getitem, dw\_1.setitem will get the data from a column and row and set the data back to them.

Getitem has many forms based on the data type:getitemstring will retrieve a string, getitemnumber retrieves a number and getitemdate or getitemdatetime will retrieve the dates or datetime.

If you check the itemchanged event in the master windows, you will find some of the commands used there for verifying data entered.

Dw\_1.getchild command is useful for manipulating the dropdowns in the datawindow and any child windows.

Dw\_1.setsort("colname asc/desc") //sort is defined

Dw\_1.sort() //actual sort is performed

Dw\_1.setfilter("colname=value") // set to filter out data

Dw\_1.filter() //actual filtering performed

```
Dw_1.getsqlselect() //sql query used in the datawindow  
Dw_1.setsqlselect("sql query") // set a new sql select  
query
```

//Check datawindow control in PB help get a full list of datawindow functions.

//Same way properties can be managed by code in the runtime or program in the columns of the data window.

For example, you want to manipulate the visibility of the column based on some logic. It can be coded on the datawindow itself or at the runtime in the window script.

Dw\_1.describe(property list)//Use Describe to understand the structure of a DataWindow. For example, you can find out which bands the DataWindow uses and what the datatypes of the columns are. You can also use Describe to find out the current value of a property and use that value to make further modifications at runtime.

Ex: string ls\_data\_type = dw\_1.Describe("salary.ColType")  
It will return the column type of salary.

Datastore: Datastore is a nonvisual datawindow control.

There are many uses for datastore. Holding the data in datastore can be distributed across many datawindows.

Nested objects on datawindow.

Rowscopy and rowsmove. Rows can be copied between datawindows and moved across.

\*\*\*\*

### **Script for the Browse button**

The script for the Browse button creates an HTML string from the data in the DataWindow by assigning the Data.HTMLTable property to a string variable. After constructing the HTML string, the script adds a header to the HTML string. Then the script saves the HTML to a file and runs the Web browser to display the output.

```
String ls_HTML, ls_FileName, ls_BrowserPath  
Integer li_FileNumber, li_Bytes,  
Integer li_RunResult, li_Result
```

```
// Generate the HTML from datawindow.
```

```

ls_HTML = dw_1.Object.DataWindow.Data.HTMLTable
IF IsNull(ls_HTML) Or Len(ls_HTML) <= 1 THEN
    MessageBox ("Error", "Error generating HTML!")
    Return
ELSE
    ls_HTML      ="<H1>HTML      Generated      From      a
DataWindow"&
        + "</H1><P>" + ls_HTML
END IF

//Create the file.
ls_FileName = "custlist.htm"
li_FileNumber = FileOpen(ls_FileName, StreamMode!, &
    Write!, LockReadWrite!, Replace! )

IF (li_FileNumber >= 0) THEN
    li_Bytes = FileWrite(li_FileNumber, ls_HTML)
    FileClose(li_FileNumber)
    IF li_Bytes = Len(ls_HTML) THEN
        // Run Browser with the HTML file.
        IF Not FileExists(is_Browser) THEN
            cb_selbrowser.Trigger Event Clicked()
            IF NOT FileExists(is_Browser) THEN
                MessageBox("Select Browser", "Could &
not find the browser.")
                RETURN
            END IF
        END IF
    END IF
    li_RunResult = Run(is_Browser + " file:///+"&
        ls_FileName)
    IF li_RunResult = -1 THEN
        MessageBox("Error", "Error running browser!")
        END IF
    ELSE
        MessageBox ("Write Error", &
            "File Write Unsuccessful")
    END IF
END IF

```

```
ELSE
    MessageBox ("File Error", "Could not open file")
END IF
```

\*\*\*\*\*

Did you know you can run SQL commands from the windows?

You can use the paste Sql button to generate SQL commands from the tables available with the DB connection. You can even declare cursors and run them in the pb windows.

The only problem you may encounter with an MS SQL server is that you can't have two SQL commands running simultaneously. So you can use a datastore to run the second command or you can create a new transaction object and run them, which can slow the connection a little.

You can access the events and functions from the inherited master with a . notation parent.

You can even disable the parent code.

## **Chapter 3**

PowerServer is a tool to distribute the PowerBuilder software through the internet to the users. The compiled .pbx will be stored and can be distributed to the users.

## Chapter 4

### **.Net technology and PowerBuilder:**

.Net technology was available from version 11 and it becomes more powerful day by day.

In version 11 you can convert the code to c# version and can load in an IIS server and run as a web application. There was not much control over the generated software and it was a little slow to run. But now with subsequent versions and at present version 2022Beta2, they have come up with editing the generated code for errors in the construction of the code.

It is interesting to check out this feature.

I will bring out the details of using this feature in subsequent books.

# Chapter 5

## Reports

There are many types of reports available with PowerBuilder.

You can prepare a report as a datawindow and put it on a window for the reports to activate and print ready.

There are many formats available for reports.

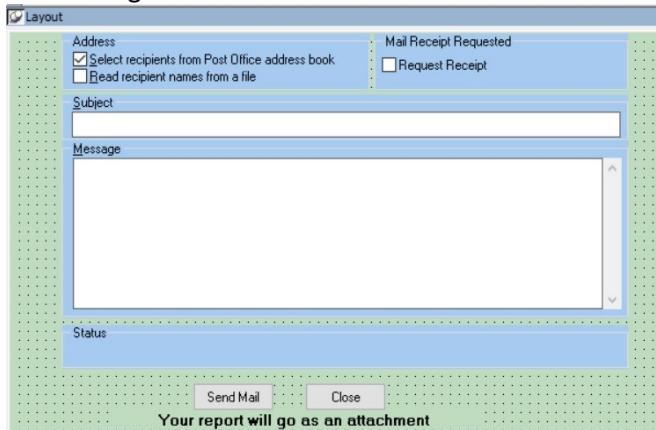

1. Composite datawindows allowed more than one datawindow to be placed on the datawindow reports.
2. the report can be retrieved with the retrieval arguments called on the main datawindow and these or any other column value can be passed on to the datawindows to retrieve the reports.
3. CrossTab Reports are useful when preparing data from multiple values. Like branches and years of data.
4. Freeform is used for the master data from a single row. This format is mainly used in data entry operations.
5. Graph is as the name suggests can prepare any type of graph from data supplied.
6. Grid is useful for letting the user have a look at the data in horizontal form and the length of the columns can be manipulated at run time. Useful for data entry or reports where data is presented in multiple rows.
7. Group reports with items grouping.
8. Label You can create Labels and print addresses and like.
9. N up The N-Up style presents two or more rows of data next to each other. It is similar to the Label style in that you can have information from several rows in the database across the page. However, the information is not meant to be printed on labels. The N-Up presentation style is useful if you

have periodic data; you can set it up so that each period repeats in a row.

10. Ole2.0 External links can be attached to the datawindows.
11. Rich text formatting can be done
12. Tabular is similar to grid, but there are no grid lines and columns can't be automatically manipulated at runtime.
13. Treeview

It is interesting to work with many formats of datawindows.

## Mail Configuration in PowerBuilder:

//open event code, so it can receive the details from the button

dw\_1 = Message.PowerObjectParm

//send mail event code

## **Epilogue**

There are many commands available in PowerBuilder, which we can check out when required. PowerBuilder has an excellent help feature. One can learn PB by searching for commands from the help. There is also help available online from Appeon Website. And there are online forums where help is available.

For source code and database schemas contact the writer:  
on these email ids: [ravi\\_kp\\_com@yahoo.com](mailto:ravi_kp_com@yahoo.com),  
[ravikiransofttech@gmail.com](mailto:ravikiransofttech@gmail.com)

This book is a continuation of the book : Develop Software with PowerBuilder, which describes the development of master windows, which was incorporated in the Part 1.

This was done so the readers of this book can develop or practise the software from scratch.

You can get the book on the website:  
<http://ravikirantechonosoft.in> or  
<https://ravikumar.azurewebsites.net>

All the links are provided on the above website.

This is a small project compared to others. This application was developed using PowerBuilder with sqlserver2000 on a Windows server. But maintenance was done for 10 years. As requirements and new insurance companies were added, new types of policies came, new processes were introduced by the insurance companies, and constant modifications are necessary.
