# Foreword

This book on software development is meant for beginners, who want to learn software coding on PowerBuilder. There are techniques to develop screens, with the detailed use of the screens and their place in the software. If anyone is interested to have the source code they may contact on these email ids:

[ravi\\_kp\\_com@yahoo.com](mailto:ravi_kp_com@yahoo.com) or  
[ravikiransofttech@gmail.com](mailto:ravikiransofttech@gmail.com)

My Books website: <https://ravikiran.azurewebsites.net/>

All my books links are available in the website.

Also free pdf copies available.

You are welcome to contact me for any kind of support.

Write to me @ [ravi\\_kp\\_com@yahoo.com](mailto:ravi_kp_com@yahoo.com) for a quicker reply.

# Preface

In my 30+ years of experience I have Developed many software for many companies in different technologies and different domains. I have worked extensively with PowerBuilder and Visual Studio developing Applications and web applications. This book is about how to start with PowerBuilder. It is assumed that you have some basic knowledge of using PowerBuilder.

Ravi Kumar Paramkusam

# Acknowledgements

This is to acknowledge the developers who have worked with me all these years.

*This book is dedicated to all the companies and developers, I worked for and developed software.*

# Chapter 1

## Introduction

PowerBuilder is a GUI-based software development tool that follows all OOPS concepts.

Inheritance is the main concept in developing in 'PB' in short it is called, which reduces the development time.

PB is an evolving software. From v5 in 1998 now after releasing v12.5, they started naming versions by the year. The latest version is 2022 release 2Beta.

Some say "Thousands of PowerBuilder applications still run today. Even though the platform is supposedly supported, its development has been slow in the past decade. It has changed hands multiple times which has caused the technology to become less desirable and lacking basic functionality from more modern platforms."

But it is not true that it is lacking basic functionality, it is a robust program and 'datawindows' is the best functionality that exists on any platform. Datawindows allows to retrieve the data from tables and allows it to update the tables with just one command. It can recognize whether the data is newly updated, modified, or deleted and act accordingly.

PowerBuilder is compatible with all the modern databases. It comes preloaded with most of the database drivers. Others can be downloaded from their respective websites.

It has the latest functionality to update with JSON, XML, or any other type of data like Excel, CSV or any other table-based data.

New releases of the PB mostly focus on .net compatibility. From Version 11 conversion to .net started. The code can be converted to Asp.Net and ported to IIS and run as a web-based application.

The latest version contains Powerscript migrator, which converts PowerBuilder code to C# code.

Powerserver helps to distribute the PowerBuilder application through the web to multiple locations.

But first I will show how to create master windows for the best performance. This is the first step in developing applications at rapid speed.

There are two main master windows one with a single datawindow for master data entry and double datawindows for master details type data entry. Then there are two types of report masters. The first type does not use any retrieval arguments and is mainly useful for displaying master data and simple reports. The second report master window uses retrieval arguments like dates and other data. Based on the data selected the report is retrieved and there are buttons for zooming the data and send to a printer.

## Development of Master windows

This is the single datawindow master window. The white space in the middle of the window is the one where we will place datawindow. I will show how the datawindow is made later in the chapter.

Now let us see what the page consists of. The ribbon containing the commands Save, Modify, View, Delete and Cancel is called a user object. A user object can be created and this object is created by placing buttons and writing code for the buttons.

### **Global variables**

```
string coname,addok,am,fayear,module,machine, loc,  
username
```

```
string voutype,ind_pol, corp_pol, pre_auth, claim_reg,  
companyname,company, branch, ls_string, gs_fayear,  
gs_custcd, claim_proc, claim_set, mis_rep ,ttype
```

```
date std_date,today
```

```
datetime lst_date,fafdrdt,fatodt,sysdatetime
```

```
int level
```

```
long ctr,ref_no
```

```
char login,item_flag
```

```
int ts
```

```
DataWindow gdw1,gdw2
```

```
string gs_which_window
```

```
char o_flag,sales,stores,purchase,finance,setup,other
```

```
datawindow dw_x
```

```
datawindowchild dwc
string pay,fin,pname,g_logincd,g_login,stype
string chk,subaccd
real amt
long vouno
string ptype,ins_co,ins_type,contype
```

### Instance variables fr user object

```
datawindow dw_1
boolean commit_flag,save_flag
function: uof_reg returns none, input datawindow dw_1a
dw_1=dw_1a
```

### Code for save button:

```
dw_1.setredraw(false)
integer rtn
if delete_flag = true then
if messagebox("CONFIRM DELETE", "Are you sure you want to
delete this record?",Question!,YesNo!,2) = 1 then
    rtn = dw_1.deleterow(0)
    if rtn = 1 then
        parent.triggerevent("delete_event")
        rtn = dw_1.update()
        if rtn = 1 then
            commit using sqlca;
w_mastermenu.sle_1.text = "Record has been deleted."
        delete_flag = false
        pb_cancel.triggerevent("clicked")
```

```

        else
messagebox("Deletion Error","Related Data Exists
        pb_cancel.triggerevent("clicked")
end if
end if
        end if
else
        parent.triggerevent("save_before_event")
        if update_flag = true then
                rtn = dw_1.update()
                if rtn = 1 then
                        parent.triggerevent("save_event")
                                if commit_flag = true then
                                        commit using sqlca;
w_mastermenu.sle_1.text = "Records have been saved."
                                update_flag = false

                pb_cancel.triggerevent("clicked")
                        else
                                rollback using sqlca;
                        end if
                else
messagebox("Save Error","Save has been cancelled")
                                rollback using sqlca;
                end if
        else
                rollback using sqlca;
        end if
end if

```

```
dw_1.setredraw(true)
```

**code for modify button:**

```
dw_1.setredraw(false)
delete_flag = false
parent.triggerevent("modify_before_event")
if ts=1 then
    return 1
end if
dw_1.reset()
dw_1.insertrow(0)
dw_1.setfocus()
parent.triggerevent("modify_event")
dw_1.setredraw(true)
```

**code for view button:**

```
dw_1.setredraw(false)
delete_flag = false
parent.triggerevent("view_before_event")
if ts=1 then
    return 1
end if
dw_1.reset()
dw_1.insertrow(0)
dw_1.setfocus()
parent.triggerevent("view_event")
dw_1.setredraw(true)
```

**code for delete button:**

```
dw_1.setredraw(false)
```

```
parent.triggerevent("delete_before_event")
```

```
if ts=1 then
```

```
    return 1
```

```
end if
```

```
dw_1.reset()
```

```
dw_1.insertrow(0)
```

```
dw_1.setfocus()
```

```
dw_1.setredraw(true)
```

**Code for cancel button:**

```
parent.triggerevent("cancel_event")
```

**Code for exit button:**

```
if dw_1.modifiedcount() + dw_1.deletedcount() > 0 then
```

```
    if messagebox("UNSAVED CHANGES!", "Do you wish to  
exit without saving ?", Question!, YesNo!, 2) = 1 then
```

```
        close(parent)
```

```
    end if
```

```
else
```

```
    close(parent)
```

```
end if
```

**Next code for the master window:**

**Code for open event of the window:**

```
dw_1.settransobject(sqlca)
```

```
w_mastermenu.pb_1.enabled = false
```

```
uo_2.uf_register(dw_1)
```

```
setbuttons(true)
```

```
uo_2.pb_new.triggerevent(clicked!)
```

```
i_height = this.height
i_width = this.width
sle_1.taborder = 0
dw_1.modify("datawindow.color="+string(rgb(216,228,248))
+""")
rr_1.fillcolor=rgb(216,228,248)
return 0
```

### **Code for close event:**

```
w_mastermenu.pb_1.enabled = true
// the main window will open
commit using sqlca;
// all the pending data updates will be committed
```

### **clicked event of the window – useful for web application**

```
#IF Defined PBDOTNET THEN
    dw_1.JavaScriptFile = "MyScriptFile.js"
    dw_1.OnClientClicked = "MyDWClickedEventHandler"
#END IF
****
```

### **Instance variables**

```
integer i_height, dw_height, dw_width
integer i_width, error_flag
string i_dml_flag, colname
long l_rows
int finyear
```

### **Function setbuttons: Boolean a\_type as input returns none**

```
//this function sets the buttons as per the user type and
module can be reconfigured
```

```
//string add,del ,mod
//Instant variables datawindow dw_1, boolean update_flag,
//delete_flag, newflag,commit_flag

## Second single master window with list option

### Extra code for List

**This list will only work if a datawindow is placed on dw\_2**

```
if trim(dw_2.dataobject)<>"" then
```

```
    dw_2.visible=true
```

```
    dw_2.retrieve()
```

```
end if
```

### quit event:

```
“ “
```

Event coding same as the user event

### List clicked event

```
parent.triggerevent("list")
```

### quit clicked event

```
if dw_1.modifiedcount() + dw_1.deletedcount() > 0 then
```

```

        if messagebox("Unsaved changes","Changes have not
        been saved ~n Do you wish to continue ?
        ",Question!,YesNo!,1) = 2 then
            return
        end if
    end if
end if
close (parent)

```

## Chapter 2

Now you are ready with master widows. To create windows with functionality you have to inherit one of the master windows you have developed.

Click on the inherit button beside new button and select the single datawindow window. Save the window. Create a data window from the table you want to use as a master data entry. Then another datawindow to list the data of the master.

Place these on the window and adjust the datawinodws.

*The window should look something like this.*

### Itemchanged event for dw\_1

```
er_flag = super:: event itemchanged(row,dwo,data)
choose case er_flag
    case 0
    case else
        return 1
end choose
```

**No more coding is required to run this window.**

So easy to develop the windows for master entry.

Next let us use two datawindow window to develop master, detail window for entering the data.

For this window select the double datawindow from inherit.

Prepared two datawindows one for the master data in free form and the second datawindow with details data in tabular form so data can be entered in rows.

Place the two datawindows on the window so created, it should look something like this.

### Code for editchanged event for dw\_1

```
dwo.name='ref_no' then
```

```
    if data<='9' then
```

```
        dw_1.getchild("ref_no",dwc)
```

```

        next
        dw_1.retrieve()
end if

```

## Chapter 3

Here I will explain some of the commands which will be useful in developing software.

Datawindow commands:

`Dw_1.insertrow(0)` : inserts a row in datawindow `dw_1`

`Dw_1.deletetow(rowno)` marks for deletion the `rowno`

`Dw_1.update()` updates the datawindow to the table

If status of the `dw_1.getitemstatus(rowno,0,primary!)` is `new!` the row will not be updated. If the status is `NewModified` the row will be inserted into the table. If the status is `DataModified` the row data is updated to the table. If `NotModified!` Nothing will happen.

Same way `dw_1.setitemstatus(rowno,colno,primary!,status)` can reset the status of the row or column with status explained above.

There are many properties for datawindow which can be altered programitacally.

`Dw_1.accepttext()` updates the text entered in the datawindow. It will be useful when checking the data entered in the present row. Data as the `enteredvalue` can be checked after passing `accetedtext()`.

`Dw_1.getitem`, `dw_1.setitem` will get the data from a column and row and set the data back to them.

`Getitem` has many forms based on the data type:`getitemstring` will retrieve a string, `getitemnumber` retrieves a number and `getitemdate` or `getitemdatetime` will retrieve the dates or `datetime`.

If you check the `itemchanged` event in the master windows, you will find some of the commands used there for verifying data entered.

Dw\_1.getchild command is useful for manipulating the dropdowns in the datawindow and any child windows.

```
Dw_1.setsort("colname asc/desc") //sort is defined
```

```
Dw_1.sort() //actual sort is performed
```

```
Dw_1.setfilter("colname=value") // set to filter out data
```

```
Dw_1.filter() //actula filtering performed
```

```
Dw_1.getsqlselect() //sql query used in the datawindow
```

```
Dw_1.setsqlselect("sql query") // set a new sql select query
```

//Check datawindow control in PB help get full list of datawindow functions.

//Same way properties can be managed by code in the runtime or program in the columns of the data window.

For example you want to manipulate the visibility of the column based on some logic. It can be coded on the datawindow itself or at the runtime in the window script.

Dw\_1.describe(propertylist)//Use Describe to understand the structure of a DataWindow. For example, you can find out which bands the DataWindow uses and what the datatypes of the columns are. You can also use Describe to find out the current value of a property and use that value to make further modifications at runtime.

```
Ex: string ls_data_type = dw_1.Describe("salary.ColType")
```

It will return the column type of salary.

Datastore: Datastore is a nonvisual datawindow control.

There are many uses for datastore. Holding the data in datastore can be distributed across many datawindows.

Nested objects on datawindow.

Rowscopy and rowsmove. Rows can be copied between datawindows and moved across.

\*\*\*\*

## Script for the Browse button

The script for the Browse button creates an HTML string from the data in the DataWindow by assigning the Data.HTMLTable property to a string variable. After constructing the HTML string, the script adds a header to the HTML string. Then the script saves the HTML to a file and runs the Web browser to display the output.

```
String ls_HTML, ls_FileName, ls_BrowserPath
Integer li_FileNumber, li_Bytes,
Integer li_RunResult, li_Result

// Generate the HTML from datawindow.
ls_HTML = dw_1.Object.DataWindow.Data.HTMLTable
IF IsNull(ls_HTML) Or Len(ls_HTML) <= 1 THEN
    MsgBox ("Error", "Error generating HTML!")
    Return
ELSE
    ls_HTML ="<H1>HTML Generated From a DataWindow"&
        + "</H1><P>" + ls_HTML
END IF

//Create the file.
ls_FileName = "custlist.htm"
li_FileNumber = FileOpen(ls_FileName, StreamMode!, &
    Write!, LockReadWrite!, Replace! )

IF (li_FileNumber >= 0) THEN
    li_Bytes = FileWrite(li_FileNumber, ls_HTML)
    FileClose(li_FileNumber)
    IF li_Bytes = Len(ls_HTML) THEN
```

```

// Run Browser with the HTML file.
IF Not FileExists(is_Browser) THEN
    cb_selbrowser.Trigger Event Clicked()
    IF NOT FileExists(is_Browser) THEN
MessageBox("Select Browser", "Could &
not find the browser.")
    RETURN
    END IF
END IF
li_RunResult = Run(is_Browser + " file:///"+&
    ls_FileName)
IF li_RunResult = -1 THEN
MessageBox("Error", "Error running browser!")
    END IF
ELSE
    MessageBox ("Write Error", &
        "File Write Unsuccessful")
    END IF
ELSE
    MessageBox ("File Error", "Could not open file")
END IF

```

\*\*\*\*

Did you know you can run sqlcommands from the windows. You can use paste sql button to generate sql command from the tables availale with the db connection. You can even declare cursors and run them in the windows.

The only problem you may encounter with MS Sql server is that you can't have two sql commands running simultanously. So you can use a datastore to run the second command or you can

create a new transaction object and run them, which can slow the connection a little.

You can access the events and functions from the inherited master with `.notation` parent.

You can even disable the parent code.

## Chapter 4

PowerServer is a tool to distribute the PowerBuilder software through the internet to the users. The compiled .pbd will be stored and can be distributed to the users.

## Chapter 5

### **.Net technology and PowerBuilder:**

.Net technology was available from version 11 and it becomes more powerful day by day.

In version 11 you can convert the code to c# version and can load in IIS server and run as a web application. There was not much control over the generated software and it was a little slow to run. But now with subsequent versions and at present version 2022Beta2, they have come up with editing the generated code for errors in construction of the code.

It is interesting to check out this feature.

I will bring out the details of using this feature in subsequent books.

# Chapter 6

## Reports

There are many types of reports available with PowerBuilder.

You can prepare a report as a datawindow and put it on a window for the reports to be activated and print ready.

There are many formats available for reports.

1. Composite datawindows allowed more than one datawindow to be placed on the datawindow reports.
2. the report can be retrieved with the retrieval arguments called on the main datawindow and these or any other column value can be passed on to the datawindows to retrieve the reports.
3. CrossTab Reports are useful when preparing data from multiple values. Like branches and years data.
4. Freeform is used for the master data from a single row. This format is mainly used in data entry operations.
5. Graph is as the name suggests can prepare any type of graph from data supplied.
6. Grid is useful for letting the user have a look at the data in horizontal form and the length of the columns can be manipulated at run time. Useful for data entry or reports where data is presented in multiple rows.
7. Group reports with items grouping.
8. Label You can create Labels and print address and like.
9. N up The N-Up style presents two or more rows of data next to each other. It is similar to the Label style in that you can have information from several rows in the database across the page. However, the information is not meant to be printed on labels. The N-Up presentation style is useful if you have periodic data; you can set it up so that each period repeats in a row.
10. Ole2.0 External links can be attached to the datawindows.

11. Rich text formatting can be done

12. Tabular is similar to grid, but there are no grid lines and columns can't be automatically manipulated at runtime.

13. Treeview

It is interesting to work with many formats of data windows.

## Epilogue

There are many commands available in PowerBuilder, which we can checkout when required. PowerBuilder has an excellent help feature. One can learn PB from searching for comands from the help. There is also help available online from Appeon Website. And there are online forums where help is available.

For source code and database schemas contact the writer: on these email ids: [ravi\\_kp\\_com@yahoo.com](mailto:ravi_kp_com@yahoo.com)

This project is explained in detail in the book:

How to do Software Programming With Examples by Ravi Kumar Paramkusam

You can get the book on the website:

<https://ravikiran.azurewebsites.net/>

All the links are provided in the above website.

This is a small project compared to others. This application was developed using PowerBuilder with sqlserver2000 on a windows server. But maintenance was done for 10 years. As requirements and new insurance companies were added, new type policies came, new processes were introduced by the insurance companies, constant modifications are necessary. Either in the application or in reports.

Web Application link to download developed using visual studio 2005, combidata.bak for sqlserver 2008. These are available in this location in zip format.

<https://www.dropbox.com/s/ent1690a1kfxq1g/Web%20Application.zip?dl=0>

PowerBuilder Application available at this location:

[https://www.dropbox.com/s/x17g6in2bgcr987/rk\\_ghpl\\_pb11.zip?dl=0](https://www.dropbox.com/s/x17g6in2bgcr987/rk_ghpl_pb11.zip?dl=0)

For any other software links to practise contact the writer on above email.

## About the Author

Ravi Kumar Paramkusam is a software professional with over 30 years experience. He has worked in many industries on multiple languages and domains.
